Captured Dimensions Overview

Captured Dimensions is a full service 3D scanning provider with years of experience in high quality human photogrammetry and other scanning methods. Our team of artists brings humans, objects, and locations to life in 3D, preparing them for many potential applications.

Mobile Photogrammetry Scanning Studio

Our self-contained mobile photogrammetry scanning trailer is the finest in the world, allowing us to pull up to any location or stage and be ready to scan on short notice. Gone are extra setup and breakdown days, thereby reducing costs, maximizing schedule flexibility and offering total talent privacy. Your A.D.s and talent will love it!

Our system contains an integrated facial detail camera array for scanning heads and faces with higher accuracy, which means no separate setup to capture high resolution expressions (FACS) for blend shapes. The 130 camera system also incorporates cross-polarized photography to capture clean diffuse textures. With our proprietary server-based system, download and review times are the fastest in the industry.

Prop Scanning

Our portable, high resolution prop scanners allow us to efficiently capture detailed objects with extreme accuracy. Paired with cross-polarized photography, our resulting prop assets are highly realistic.

Lidar and Environment Scanning

With our state-of-the-art lidar (laser capture) systems and extensive experience with photogrammetric data capture, our team can capture and digitally recreate scenes of all sizes. Everything from vehicles and large set pieces to buildings and city blocks are within our reach.

These virtual set models can be used for set extension or virtual production and digital environment creation.
